

IMPACTFUL PARTNERSHIP ANNOUNCED BETWEEN HIGH PLAINS BIOCHAR & THE CARBONEERS

High Plains Biochar provides technology designs to manufacture over 700 Biochar stoves for carbon removal projects in Ghana & India

LARAMIE, WY, Sept. 2024 - High Plains Biochar is thrilled to announce our partnership with The Carboneers. The Carboneers are a leader in carbon removal projects worldwide. We are excited to team up with them for their projects in Ghana and India. High Plains Biochar signed an agreement with the Carboneers to be the technology provider for these initiatives. The Carboneers will utilize High Plains Biochars stove designs to manufacture over 700 of our new Big Boy stoves. We are eager to see this project in action and are excited to assist in the removal of meaningful amounts of carbon through our technologies. We look forward to future partnerships and opportunities with the Carboneers. They are committed to carbon removal and we are thrilled to assist them in reaching their goals.

The Big Boy stove is designed to be set above a conventional burn pit. It encloses the flame reducing the fire hazard potential. The design also significantly reduces the emissions compared to a conventional burn pit or a Kon Tiki, making the process better both for the user and the environment. Having the pit covered also allows for a full cool down after quenching rather than having to dig out the

biochar while it is still warm. This stove was designed with the global south in mind. It allows for large volumes of biochar to be created but with less risk. This is a very versatile design that can be altered to fit the feedstock and location needs with minimal changes.

“We are excited to see where this partnership leads and are eager to see all the work the Carbonneers have put in come to fruition utilizing High Plains Biochar technology. We look forward to finding partners to help change the world one stove at a time,” commented High Plains Biochar founder & CEO, Rowdy Yeatts.
